Rancho Santa Ana Botanical Garden (RSABG) "California's Native Garden" by Johnny Aguila & Wayne Smith

What a peaceful spot nestled in the city of Claremont, near the foothills of the San Gabriel Mountains. The Garden was first established by Susanna Bixby Bryant, a member of one of California's pioneering families in 1927, on her rancho in Orange County. With over 6,000 kinds of native plants, California has the richest flora of any state in the continental United States and Susanna recognized the need to conserve this plant diversity. Later relocated to Claremont in 1951, this 86 acre Garden is the largest botanical garden dedicated exclusively to our state's native plants.

RSABG's mission promotes botany, conservation and horticulture to inspire, inform and educate the public and the scientific community about California's native flora. The Garden is devoted to the collection, cultivation, study and display of native California plants and to graduate training and research in plant evolution. Through all its programs, the Garden makes significant contributions to the appreciation, enjoyment, understanding and thoughtful use of our natural heritage.

The Garden's living collection represents nearly fifty percent of the entire plant heritage of California, and is sure to provide you with plenty of new and fascinating experiences with each visit. Experience the changes in colors and textures of the Botanic Garden throughout the seasons.

There are 3 unique areas to be explored: Indian Hill Mesa, the East Alluvial Gardens, and the Plant Communities. Take a relaxed stroll along the Garden's meandering pathways, attend classes on native plant gardening, explore native landscape designs. Visit the Garden Shop to find more ideas for your native garden, unique books and gifts, and tips for green living. Brochures are available for self-guided walks and tour guides are available with a 2 week advance notice.

Special thanks to Bart O'Brien, Director of Special Projects, for his well-informed talk and tour.

Located @ 1500 N. College Ave. Claremont, CA 91711.
Ph. (909) 625-8767. Open 8:00 a.m. to 5:00 p.m. Starting March 29, 2009 there will be an admission fee for garden visitors.

UPCOMING MEETING INFORMATION

MAY 21, 2009

Scholarship Essays— Part 1

The Importance of Trees— by Hector Ramirez

We tend to ignore the crucial importance trees have on our society. Trees in general play a vital role in our everyday existence as human beings. There are a plethora of benefits that trees provide us, either in the urban forestry realm or on the streets adjacent to our homes. However, the role street trees have on our communities clearly indicates the need to focus more attention on arboriculture and spread the wealth of knowledge within the community.

The most obvious function of street trees is to beautify our communities and to increase the value of our homes. There is clearly a difference between residential tracts that have no trees and tracts filled with trees. It seems that residential tracts lacking in trees look plain and without life. Residential tracts lined with redwoods or carrot woods tend to give more life to the area. Trees also have a tendency to increase property values because they are an added value to the community.

Street trees also have a psychological soothing effect on us. In the fast pace society that we live in, it is important to temporarily disassociate ourselves and relax. Trees in general, whether in a park or street, enable us to relax and reflect on stresses encountered during the day.

There are several environmental benefits street trees provide us. Street lined with trees provide wind-break which slows down the movement of air as it nears buildings or homes, thereby decreasing the possibility of damaged property. Trees on streets also create shade and

have a cooling effect on structures. This enables us to turn down our air conditioner during hot summers; by doing this less energy is used and more money is saved. Much is said about the dangers of smog and the destruction of the

ozone layer. However, tree canopies engulf dangerous pollutants and cleanse the air we breathe. The process of photosynthesis, which occurs in trees, removes excess carbon dioxide from the atmosphere.

In closing, there should be a better understanding between the interplay of trees and society. Only then will we understand the true benefits trees provide us. On a basic level they provide shade and cool us off while allowing us to relax and reflect. The complex exchanges that occur within the canopies, however, are essential for our survival on earth; trees are an essential element for our survival.

Hector Ramirez is one of five 2008 Scholarship recipients. Hector is presently attending Mount San Antonio College studying Horticulture. He has been very active in several groups such as Sports Turf Club and is a member of several associations. Hector worked in landscaping for 5 years and the Pomona Unified School District for 2 years. Since August 2007 until now he is working for the City of Riverside.
